

Theorem (2.3.46). *Let x be a real number, and let m be an integer.*

$$\lceil x + m \rceil = \lceil x \rceil + m.$$

Proof. By the definition of the ceiling function, we have the follow tautology.

$$\lceil x \rceil = \lceil x \rceil \iff (\lceil x \rceil - 1) < x \leq \lceil x \rceil.$$

Adding the integer m to every side of this inequality gives the following resultant tautology, by definition,

$$\lceil x + m \rceil = \lceil x \rceil + m \iff (\lceil x \rceil + m) - 1 < x + m \leq \lceil x \rceil + m. \quad \blacksquare$$
